

# Unwinding drip tape machine

## Plastic film winder

This machine can be adapted to potato harvesters. It allows the recovery of the plastic film at the same time as the potato harvest.

This versatile work tool can also be mounted on a 3-point beam at the front or rear of the tractor, trailer or other machines.

It is composed of 2 double-conical chucks driven by a motor and a speed regulator, the whole being flanged on the outside of the chucks.

As the reel body can be rotated, the bale is released manually outside the working area if necessary.

The width of the plastic films to be recovered must not exceed 1m20
